OPERATING INSTRUCTIONS

STARTING ENGINE-ELECTRIC STARTER

- Place gear shift lever in neutral position. See Figure 1.
 (Be sure tractor is on level ground and will not roll away in neutral. Apply parking brake.)
- 2. Place choke lever in "ON" position. See Figure 1.
- 3. Set throttle lever in mid position and turn ignition key to "ON". See Figure 1. Press starter button to start engine and release. As engine warms up, return choke lever to "OFF" position.

STARTING ENGINE- MANUAL START

- Place gear shift lever in neutral position. See Figure 1.
 (Be sure tractor is on level ground and will not roll away.)
- 2. Pull lift lever handle all the way back and raise seat all the way up.
- 3. Place choke lever in "ON" position. See Figure 1.
- 4. Place throttle lever in mid position and turn ignition key to "ON" position. See Figure 1.
- 5. Engage starter rope knot in groove on starter pulley and wind rope around pulley in a clockwise direction. See Figure 2. Pull starter rope upwards, rapidly and firmly to start engine. As engine warms up, return choke lever to "OFF" position.

TO STOP ENGINE

With clutch disengaged, place gear shift in any gear and turn ignition key to "OFF" position. Engage clutch to hold tractor in parked position and remove ignition key for safekeeping. Apply parking brake!

FOR YOUR SAFETY

- 1. ALWAYS STOP ENGINE BEFORE LEAVING MACHINE
- 2. ALWAYS STOP ENGINE BEFORE SERVICING OR ADJUSTING MACHINE OR EQUIPMENT
- 3. ALWAYS KEEP HANDS, FEET AND CLOTHING AWAY FROM POWER-DRIVEN PARTS

OPERATION

OPERATION OF TRACTOR

To place gear shift in desired gear range, depress the combination brake and Clutch pedal located on right hand side of tractor. See Figure 3. When pedal is depressed move shift lever to desired position (see Figure 1) and gradually release pedal until clutch is engaged. When shifting from one range to another, pause briefly in neutral before completing shift. Set throttle lever to obtain desired speed. See Figure 1.

PARKING BRAKE

To place the parking brake hold the brake pedal depressed and slide the parking brake lever all the way to the rear of its slot and turn the lever in a clockwise direction until it is tight. Refer to Figure 4.

To release the parking brake, turn the parking brake lever in a counter-clockwise direction until the brake pedal is released.

BATTERY

Battery - The battery should be kept clean and dry at all times. Keep battery snugly fastened in place and check battery cables for tight connections. Vent caps should be kept tight, and vent holes in vent caps must be kept open at all times to permit gases formed in battery to escape. Full maintenance instructions are provided on separate instruction card for battery.

If tractor is not used for an extended period during winter, remove battery and store in a fully charged condition, in a cool place.

LUBRICATION

The tractor has a total of 3 grease fittings which require lubrication with general purpose automotive grease, Use a standard grease gun for the following fittings:

- (2) Front Spindles Figure 5.
- (1) Rear Axle Tube Figure 6.

Before lubricating, wipe each grease fitting with a rag to prevent grit and dirt from being carried into bearings with new grease.

ENGINE

Engine - Service air cleaner and crankcase as recommended in engine service manual, Be sure air cleaner is maintained in clean condition. Never use oil in crankcase for more than 25 hours of operation. See Figure 15. CLEAN AIR AND CLEAN ENGINE OIL WILL GIVE LONG TROUBLE FREE OPERATION. DIRT WILL RUIN YOUR ENGINE IN A SHORT TIME. A funnel and extension are included with the tractor for use in changing oil.

TIRES

The tires of the tractor are inflated with air pressure in excess of the normal amount for shipment. For comfort of operation, release some of the pressure until a pressure of 10 lbs per square inch (12-15 psi for Landlord 3210 models) is attained for front tires and 7 lbs per square inch (12-15 psi for Landlord 3210 models) is attained for rear tires. Maintain tires at these pressures.

MAINTENANCE

TRANSMISSION

The transmission has a capacity of 11/2 Qts. of SAE 90 oil, and is filled at the factory. It will not normally require replenishment, but occasionally check drain plug for tightness and axle tube oil seals for leakage. Maintain oil level at lower edge of filler plug hole. Remove vent plug from top of transmission and allow oil to settle to normal level before checking. See Figure 8.

BEVEL GEAR CASE

The bevel gear housing has a capacity of 1 pint of SAE 90 oil and is filled at the factory. It will not normally require replenishment, but occasionally check drain plug for tightness and oil seals for leakage. Keep oil up to level of filler plug. See Figure 9.

SETUP & ADJUSTMENTS

CLUTCH ADJUSTMENT

Position the locknuts to leave a space of about 11/16" between them and the end of the rod guide. See Figure 10.

BRAKE ADJUSTMENT

Pull the brake band up by hand 80 that it is tight around the brake drum. Adjust the nut to give a clearance of about 11/16" between the brake band and nut. Then check to see that the idler pulley releases the belt properly before the brake is applied. If the brake does not hold properly when the pedal is pushed all the way forward, reduce slightly the spacing between the nut and the brake band. Now recheck the clutch rod adjustment for proper idler release. Refer to Figure 11.

DIFFERENTIAL

NOTE: The following is NOT applicable to Landlord 2010 Models or Landlord 2012 Models.

The tractor is equipped with a Controlled Traction Differential. Tightening the hex head capscrews in the right hand wheel hub (see Figure 12), provides pressure against a nylon plug and sleeve around the tractor axle and prevents excessive wheel slippage when the tractor is being used under abnormal slippery conditions. The adjusting capscrews are set at the factory to a torque of 25 ft. lbs. As the nylon sets itself through use, it may be necessary to readjust the capscrews a few times to maintain 25 ft. lbs. of torque (25 lbs. weight on wrench 1 ft. long).

SETUP & ADJUSTMENTS

REAR LIFT GROUP INSTALLATION

The Rear Lift Group is to be installed in the following manner:

- 1. Remove 3 hex cap screws from left side of tractor as shown in Figure 13.
- 2. Swing hitch member outward and install lift assembly as shown. Return hitch member to original position and replace cap screws. See Figure 14.
- 3. Insert right end of lift assembly into hole in right hitch member and position lift assembly so that collar is flush against right hitch member. Position collar on left side of lift assembly so it is flush against left hitch member; tighten socket hd. set screw with Allen-Wrench. See Figure 15.
- 4. Connect lift assembly to Rear Lift Group. Secure with Cotter Pin. See Figure 15.
- 5. Adjust rear lift rod so that there is clearance between the gear case and the lift assembly when the lift lever is in the forward, latched, position. Also adjust the rod so that the lift assembly will strike the gear case before the lift lever strikes the air cleaner on the engine when the lift lever overtravels forward.

PTO INSTALLATION, OPERATION AND MAINTENANCE

POWER TAKE-OFF INSTALLATION

For operation of Rotary Mower and Sickle Bar attachments, a power take-off attachment is required. This consists of the power take-off assembly, "V" pulley for bevel gear shaft, drive belt, belt guard, and belt stop packaged in one carton. For ease of attachment follow the steps outlined below.

- 1. Mount Drive pulley to shaft of bevel gear assembly (See Figure 16) and secure in place with key and set screw. Hub of Drive pulley is to face inward. Place drive belt on Drive pulley and mount belt guard support to inside surface of side plate nearest drive pulley. See Figure 20 for mounting bolt location. Attach the belt guard to the guard support as shown in Figure 16. Allow approximately 3/16" clearance between belt and guard.
- 2. Holding the power take-off assembly in left hand as shown in Figure 17, position the tube of the drive bracket assembly between the bevel gear housing side plates. Align the holes in side plates with the hole in drive bracket assembly tube and insert pivot pin through holes in side plates and drive bracket assembly tube.
- 3. Push pivot pin through the holes in bracket and tube until the position of cotter pin hole in pivot pin is as shown in Figure 18. Secure in position with cotter pin furnished.
- 4. Remove hex cap screw "D" from frame of tractor and mount bracket in place on lift lever quadrant. See Figure 19. Position the pivot bar assembly flush against bottom of lift quadrant and reinstall hex cap screw and tighten securely. Check alignment of drive pulley on bevel gear shaft, driven pulley of power take-off, and idler pulley, and adjust driving pulley if necessary.

PTO INSTALLATION, OPERATION AND MAINTENANCE

5. Remove Front Hex. Cap Screw from Pull Bar. Replace with stud 157273 provided. Short end inserted. Slip on Handle Assembly and tighten with Hex Head Lock Nut to permit free movement of handle. Mount "V" Belt in place on driven pulley as shown in Figure 20 and attach spring to hole provided in the bottom of the Bracket Assembly. Hook other end of the spring to the Handle Assembly. Mount Belt Stop as shown with 3/8" Bolt, Flat Washer, Lock washer, and Hex. Nut, When Implement is attached to tractor with Idler Pulley engaged, 1/8" clearance between Belt Stop and back of "V" Belt is required. NOTE: "V" Belt runs under Idler Pulley. See Figure 20.

OPERATION

Operation of the Power Take -Off is controlled by movement of the Clutch Lever Assembly. See Figure 19. When the Clutch Lever is in the forward raised position, the Clutch Rod releases the tension holding the Idler Pulley against the Drive Belt, and power will not be transmitted to the driven pulley of the Power Take-Off Assembly. When the Clutch Lever is in the back, depressed position, the Clutch Rod applies tension to the Idler Pulley and as the Idler Pulley takes up the slack in the Drive Belt, power is transmitted from the Drive Pulley on Bevel Gear Box Shaft to the driven pulley of the Power Take-Off. Figure 19 shows Clutch Lever in Drive position.

PTO LUBRICATION

The Power Take-Off is lubricated by means of one Grease Fitting located on the bottom front of the Drive Bracket Assembly. Occasionally apply grease by means of a standard grease gun loaded with automotive type grease. Be sure to wipe dirt and grit from grease fitting before applying grease gun. Lubricate all pivot points and Idler Pulley Bearings with SAE 20 oil every few hours of operation.

ADJUSTMENT

At points "A" and "B" of Figure 19, check tightness of Hex. Nut to be sure that Clutch Lever Assembly and Clutch Rod are free to pivot without binding.

Place Clutch Lever in 'Drive" position and observe clearance between collar "C" (Figure 19) and end of bracket. When implement is attached to tractor, this clearance should normally be approximately 3/4"; at this setting the Idler Pulley should be snugly against the Drive Belt. If additional tension is required, release Clutch Lever and loosen Set Screw on Collar and Slide Collar farther back on Clutch Rod. Retighten

Set Screw in Collar and put Clutch Lever in Drive position. Recheck clearance. The tension of the Idler Pulley against the Drive Belt must be sufficient to operate whichever tractor attachment is being used. Any additional tension is unnecessary and will only cause premature failure of Belts and Idler Pulley bearings.

Simplicity

INSTRUCTIONS FOR ADJUSTING HAND LEVER AND FLOAT STOPS OF QUADRANT ON HYDRAULIC UNIT

Attach pump to pump support assembly #157420. Then attach support assembly to fuel tank and steering post support. Attach lever with connecting link to valve spool shaft.

Place the lever #157200 with the latch rod #157206 in the exact middle of the two hex cap screws "F" located in the quadrant #157199. This is done by adjusting the angle bracket #157428 and quadrant #157199 up or down on the support #157420. Tighten the capscrews securing the bracket and quadrant to the support.

Move lever to most extreme position (front or rear). Bring stop plate up so notch is striking rod #157206 and secure capscrew (F) furthest from handle. Repeat procedure to the other extreme for other stop plate.

Check rod #157206 in both positions. This rod is not to have ANY FREE MOVEMENT when in front or rear float position. Excessive play at this point increases back pressure on the pump and may cause overheating of the pump. If pump is moved to lift position (front or rear) and then drops the load before entering float position, readjust the hand lever to center of quadrant as described above. Oil lever and rod to insure free movement.

The bolts holding the pump and tank together should be checked and tightened to torque or 50-60 INCH POUNDS.
